

Long-Term Benthos Monitoring network for identifying vulnerable areas in Arctic benthic ecosystems

Logerwell L (USA), Jørgensen LL (Norway), Blicher M & Hammeken N (Greenland), Roy V (Canada), Ólafsdóttir SH (Iceland), Strelkova N (Russia), Sørensen J (Faroe Iceland), Christiansen JS, Bodil Bluhm and Fredriksen R (Norway)

Second International Science and Policy Conference on
Implementation of the Ecosystem Approach to Management in the Arctic
Bergen, Norway
June 26, 2019

State of the Arctic Marine Biodiversity

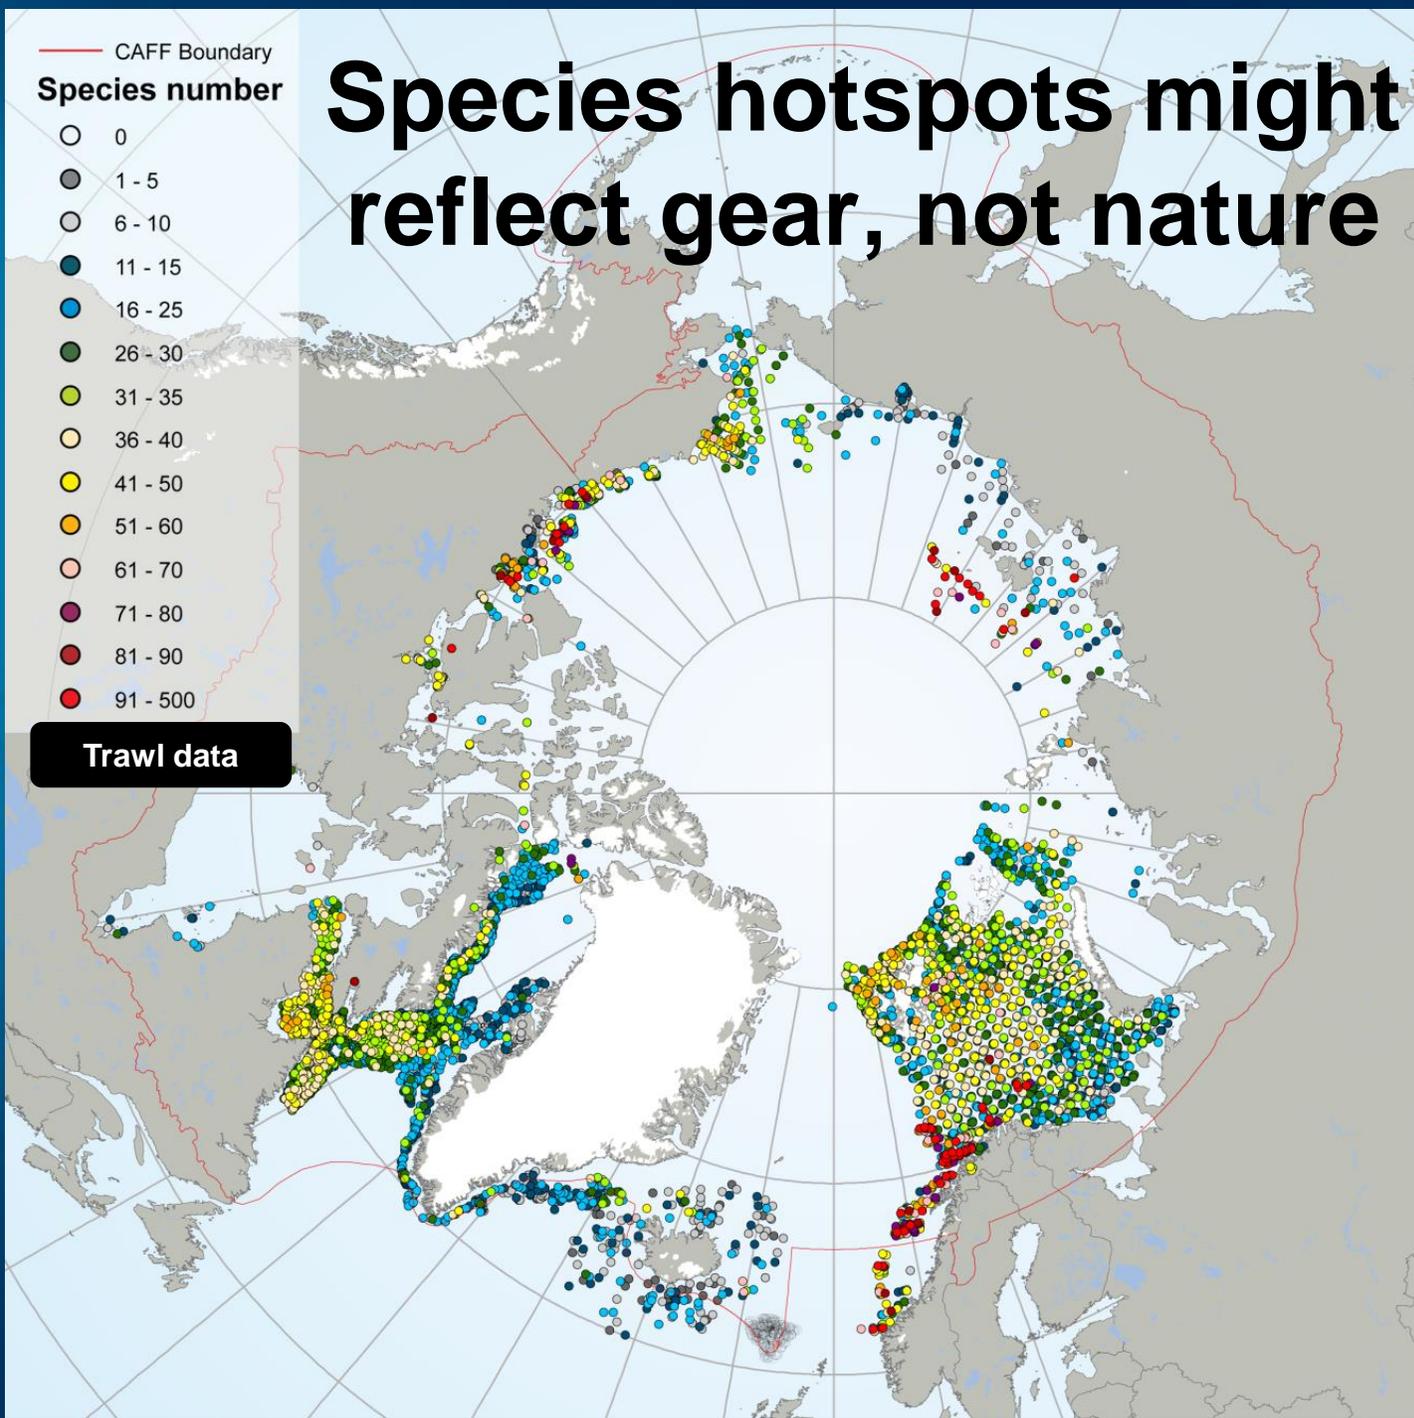

Key Findings and Advice for Monitoring

2017

How did the SAMBR challenge us?

KEY FINDING:

Lack of consistency
and methodological
standardization

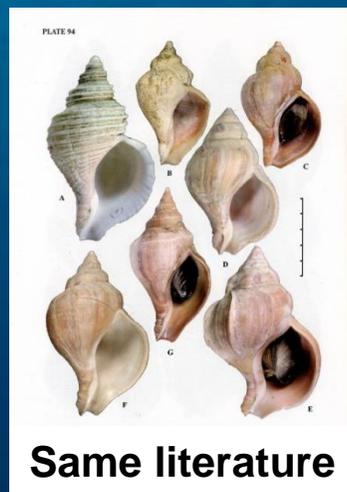

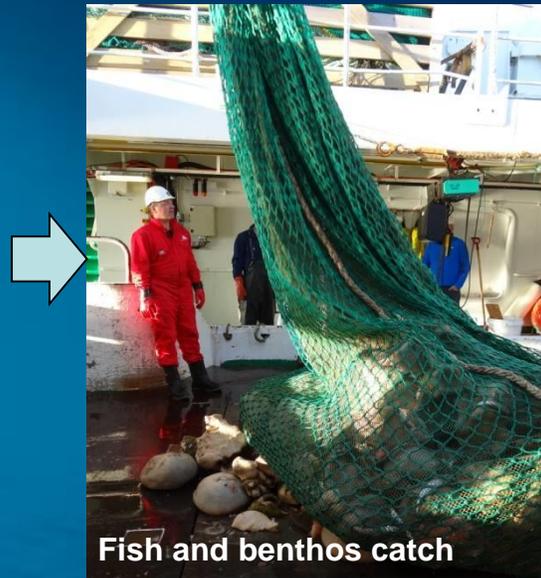

SUGGESTION:

to develop a time- and cost-
effective, long-term and
standardized monitoring of
megabenthic communities in all
Arctic regions with regular
groundfish assessment surveys.

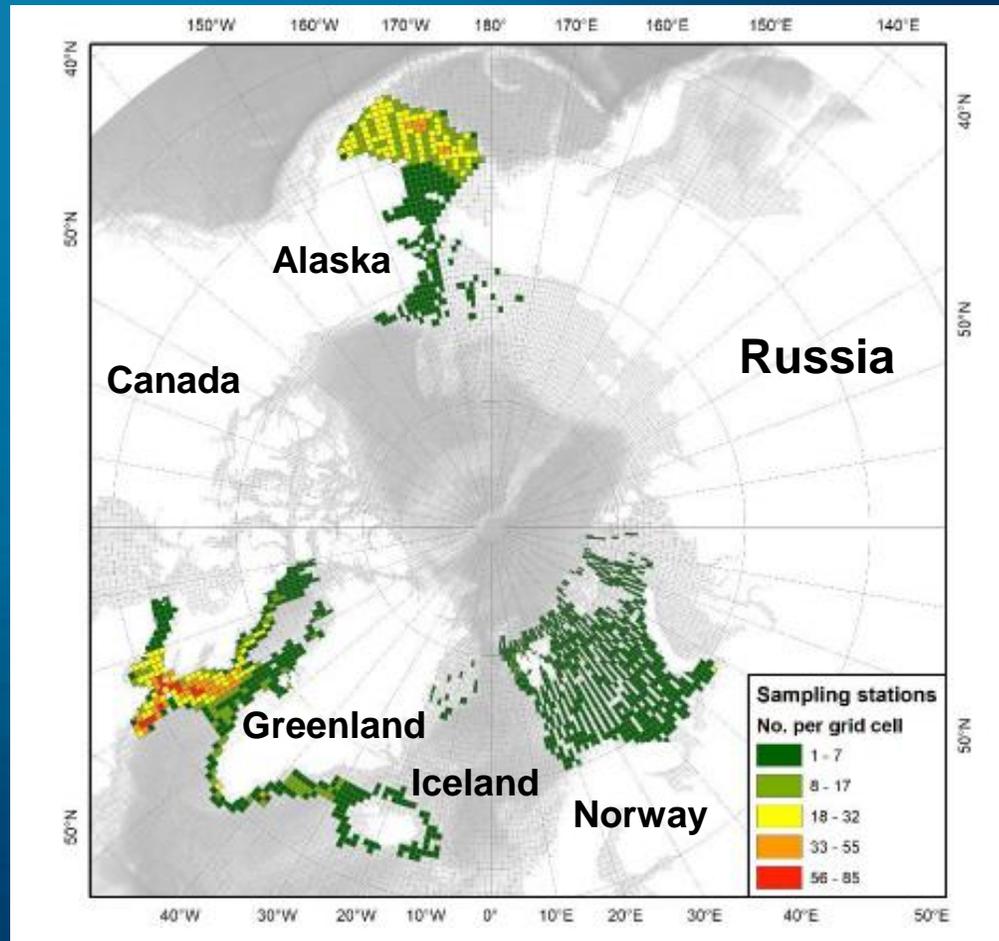

Regular groundfish assessment surveys

Database for temporal standardization

Long-Term Benthos Monitoring network for detecting changes in the Arctic benthic ecosystem (LTM-Benthos) 2017-2020

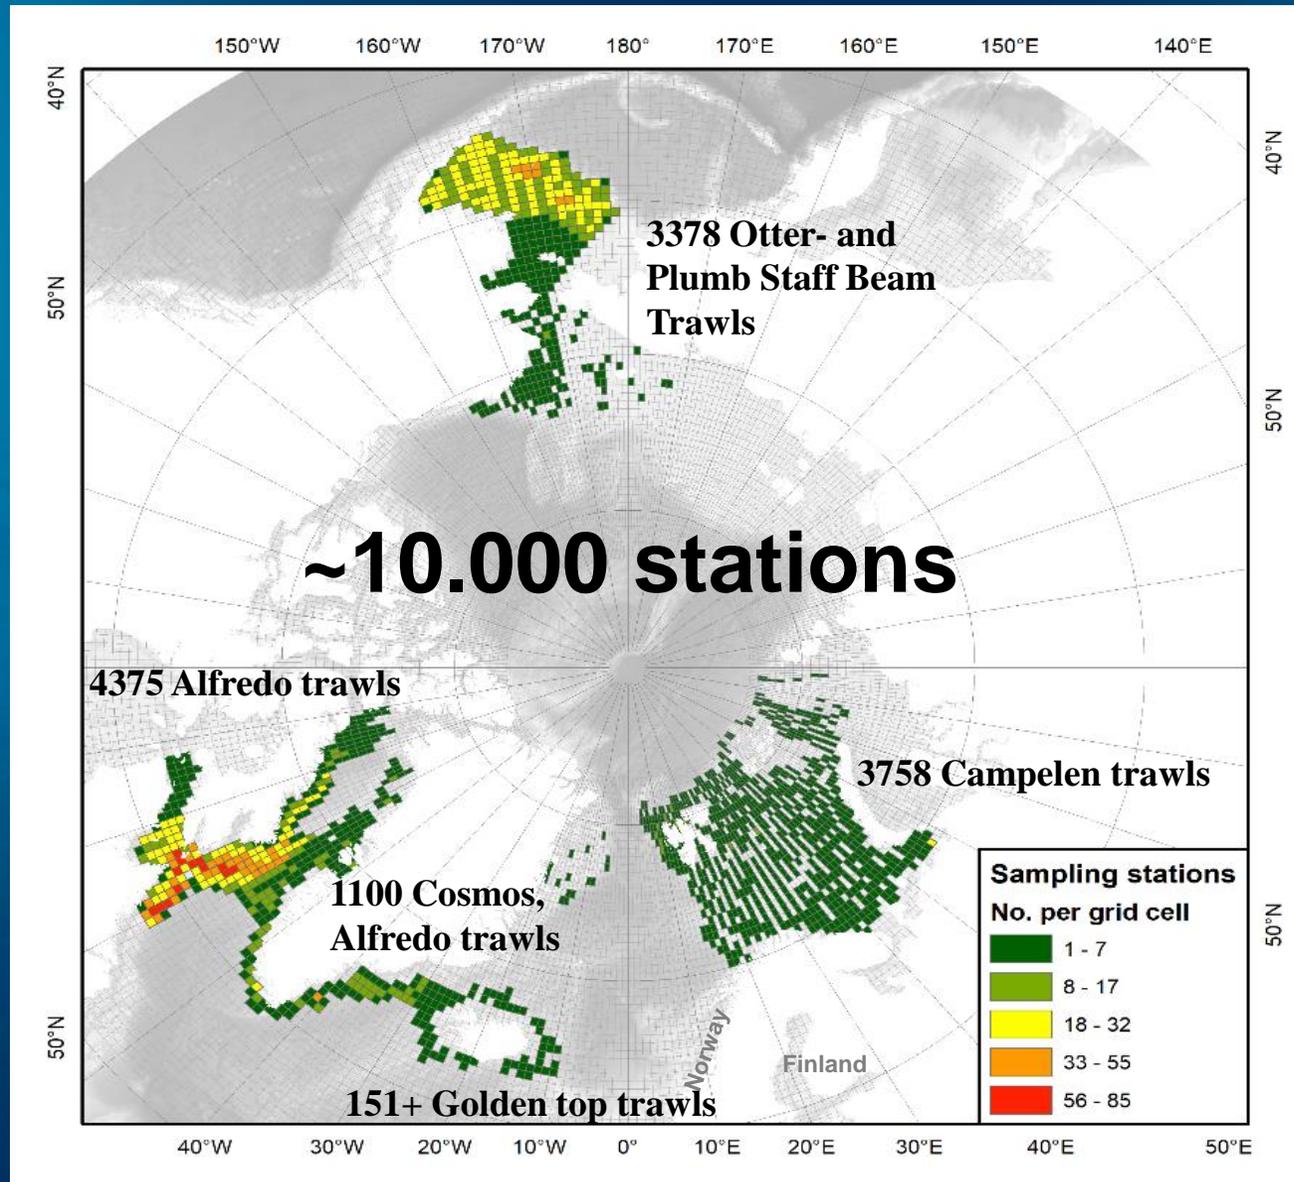

*2017 Copenhagen workshop
Funded by the Nordic Council*

MAIN GOAL

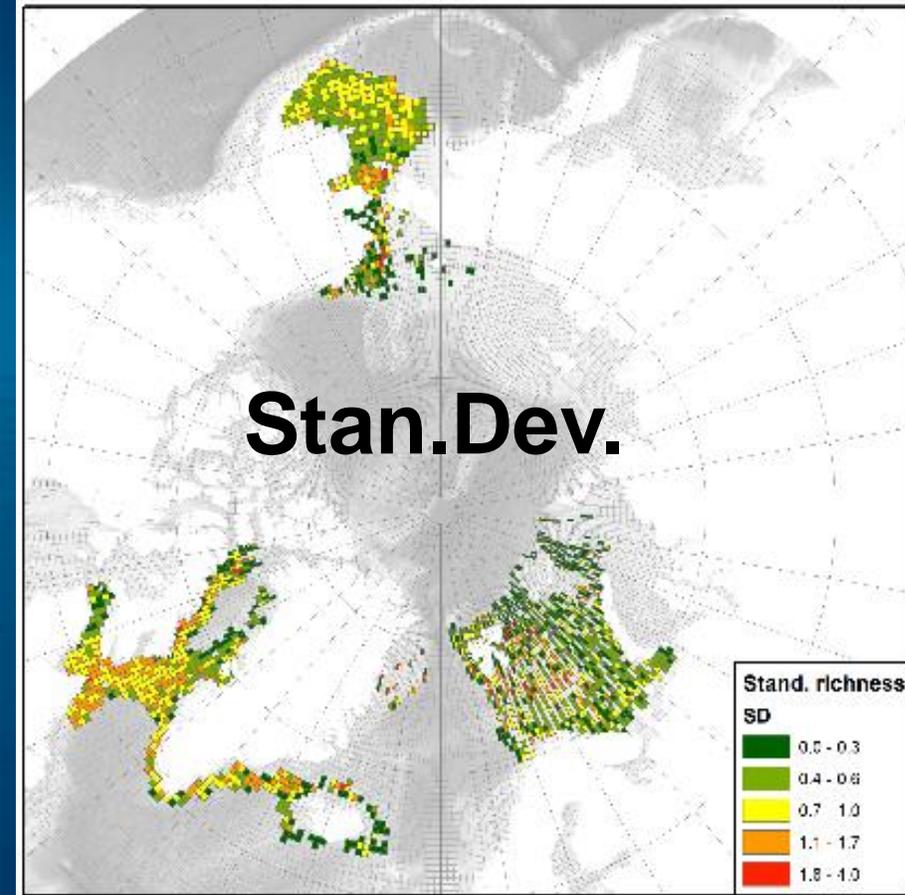

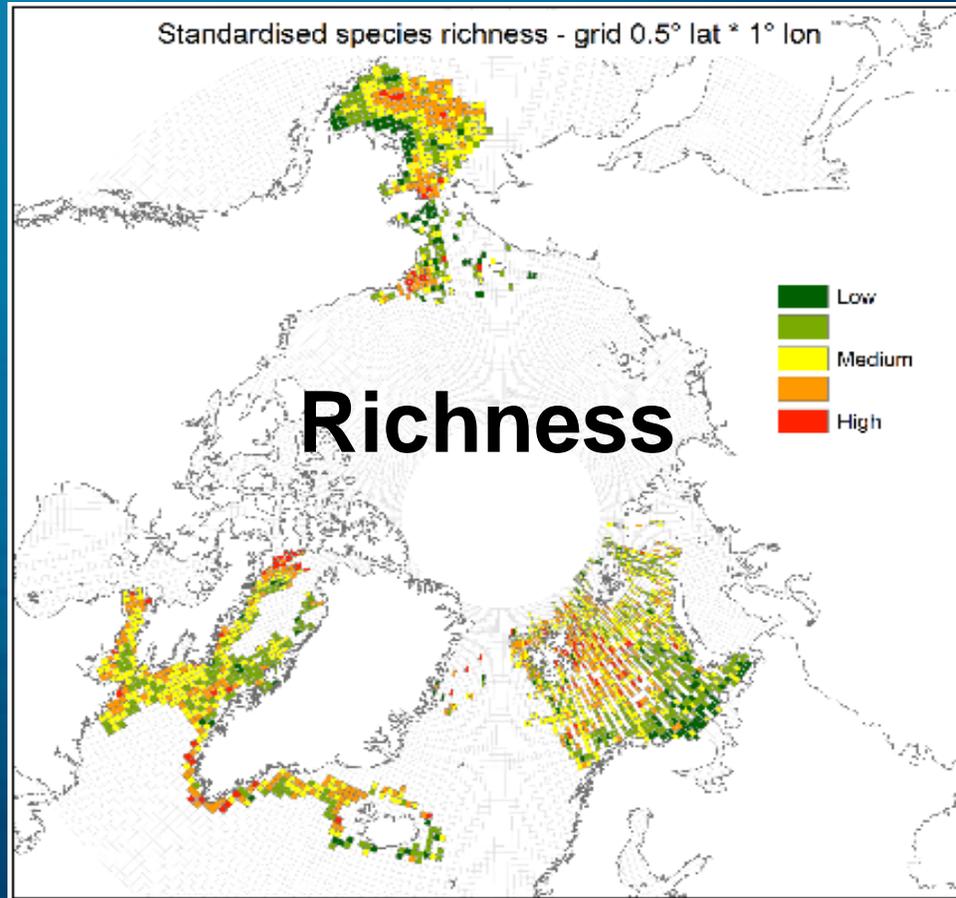

Explore how national groundfish surveys including bycatch can provide relevant data for evaluating the state of benthic communities.

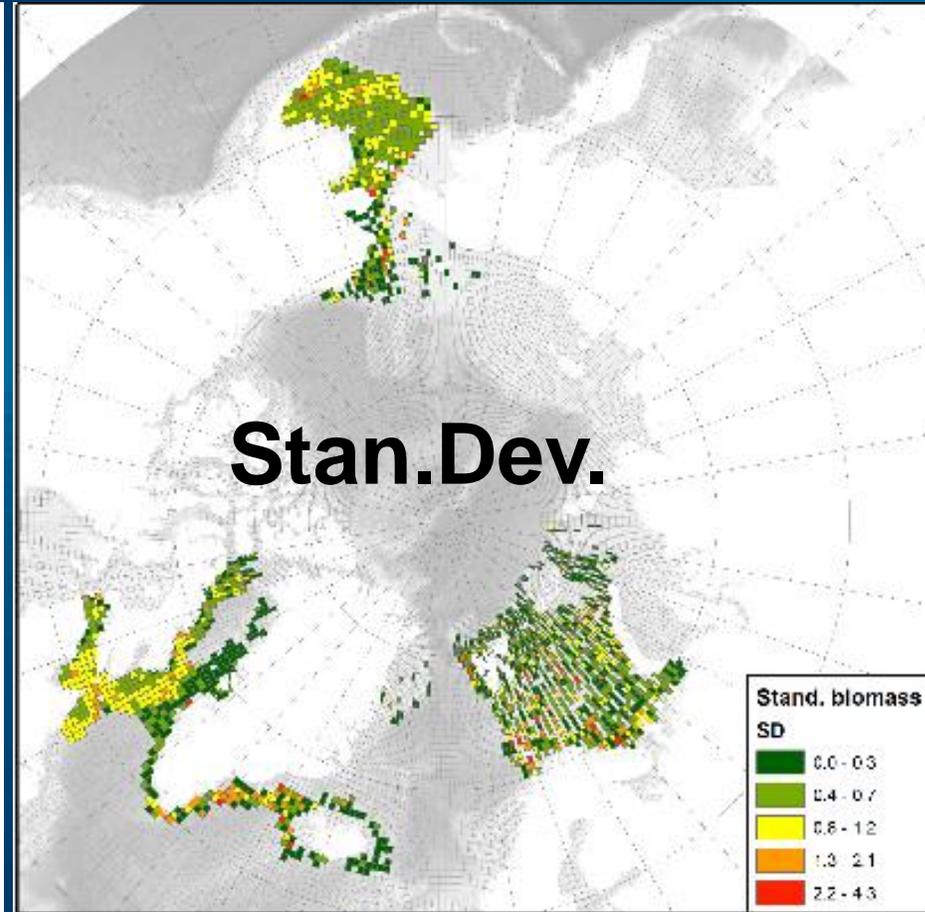

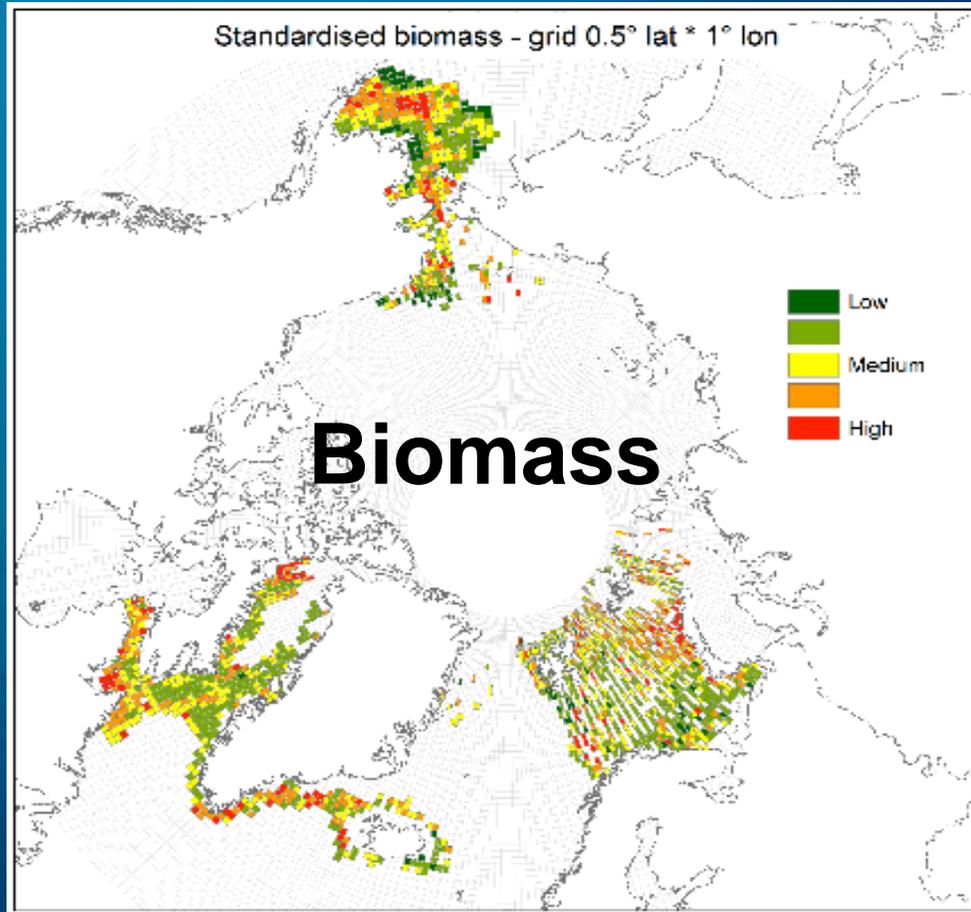

Counts per grid are the number of station samples summed over all survey years 2008-2018.

Species richness

Biomass

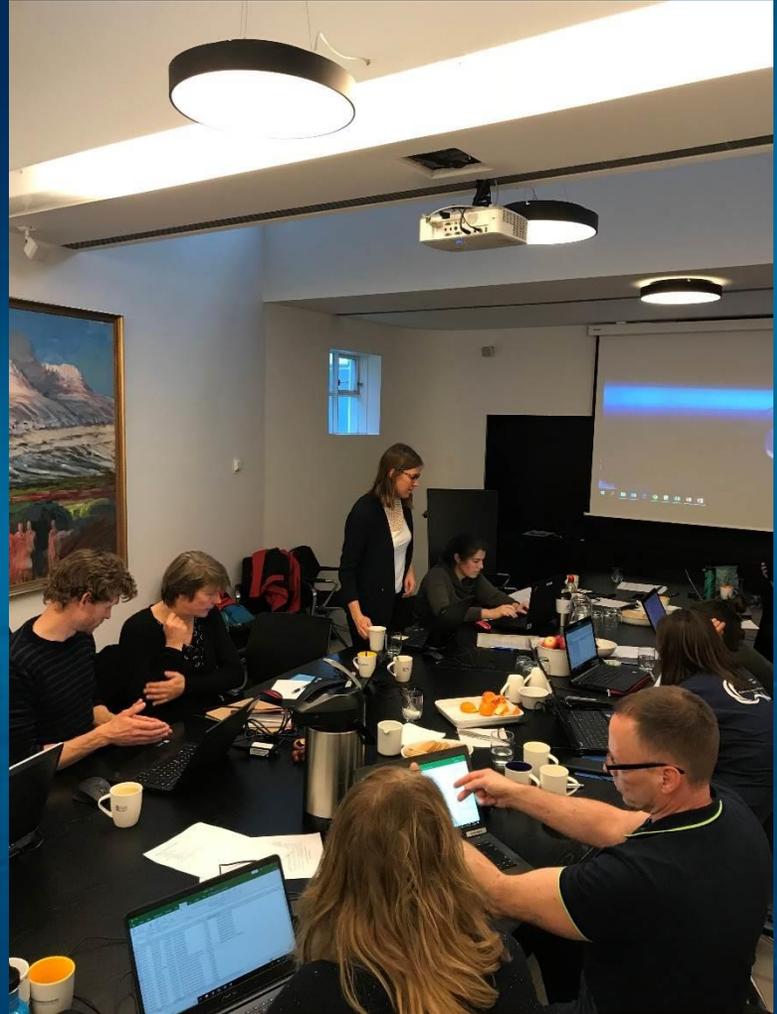

Next step:
Anthropogenic stressors

Using species **trait analyses** to identify where we find trawl vulnerable areas

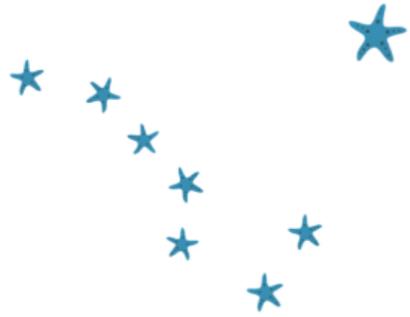

2019 workshop – Tromsø

2018 workshop – Reykjavík

Welcome to the Arctic Traits Database!

This is a freely accessible online platform to facilitate exchange of biological trait information among researchers working in the field of Arctic benthic ecology.

The focus is set on benthic invertebrates from Arctic regions, and the currently 19 traits and 80 trait categories are chosen to reflect the morphology, life history, and behavior of species within these groups. Trait information per species is provided in text format (original literature source and quote provided) and in a 'fuzzy coded' mode (scores from 0 to 3). Taxon names are synchronized with the [World Register of Marine Species \(WoRMS\)](#). More detailed information can be found in the associated publication "[The Arctic Traits Database - A repository of arctic benthic invertebrate traits](#)" and in the "[Fuzzy codes](#)" section.

Body Form

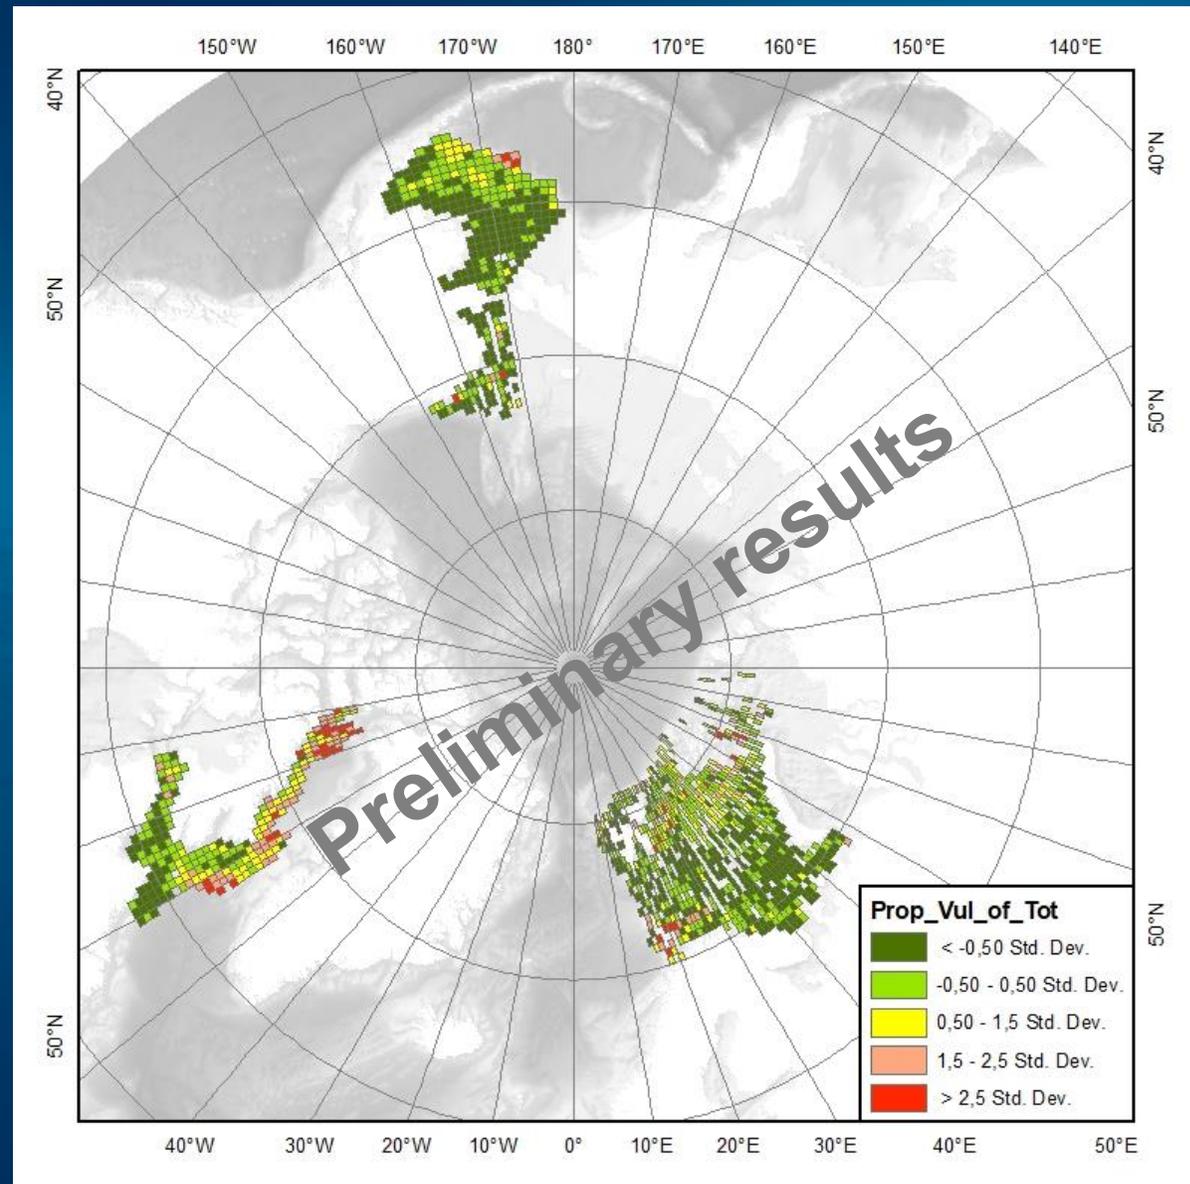

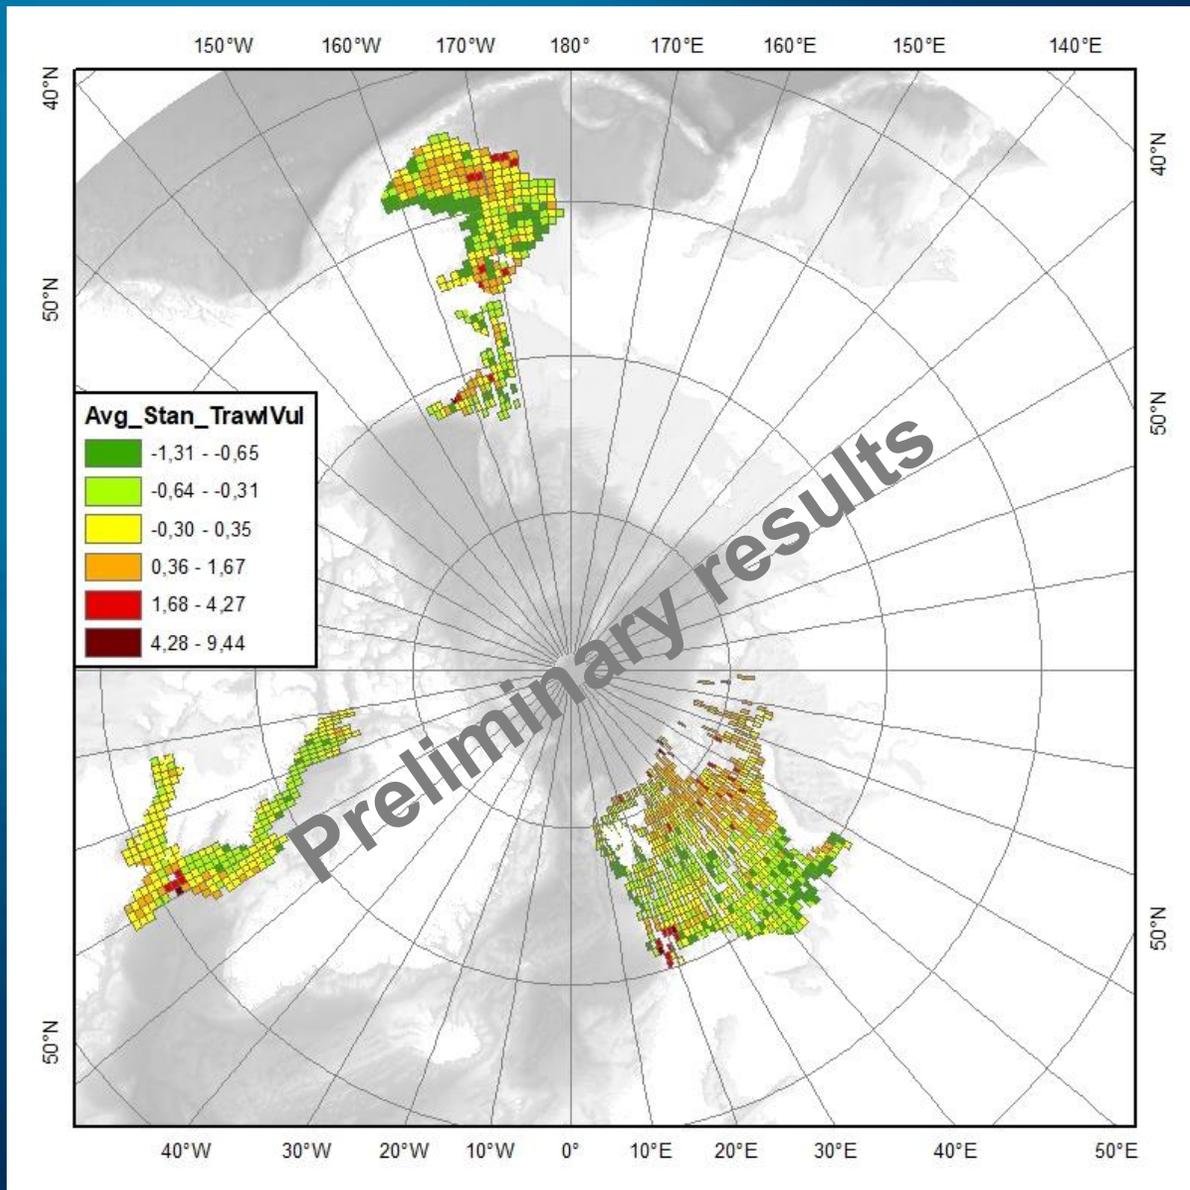

globulose	(BF1)	Round or oval (e.g. sea urchin, sponge, some bivalves)
vermiform, elongate	(BF2)	Worm-like or thin, elongate body form
dorso-ventral compressed	(BF3)	Species that are flat, or encrusting (e.g. starfish, sponge)
laterally compressed	(BF4)	Thin (e.g. isopods, amphipods, some bivalves)
upright	(BF5)	E.g. coral, basket star, sponge

Adult movement

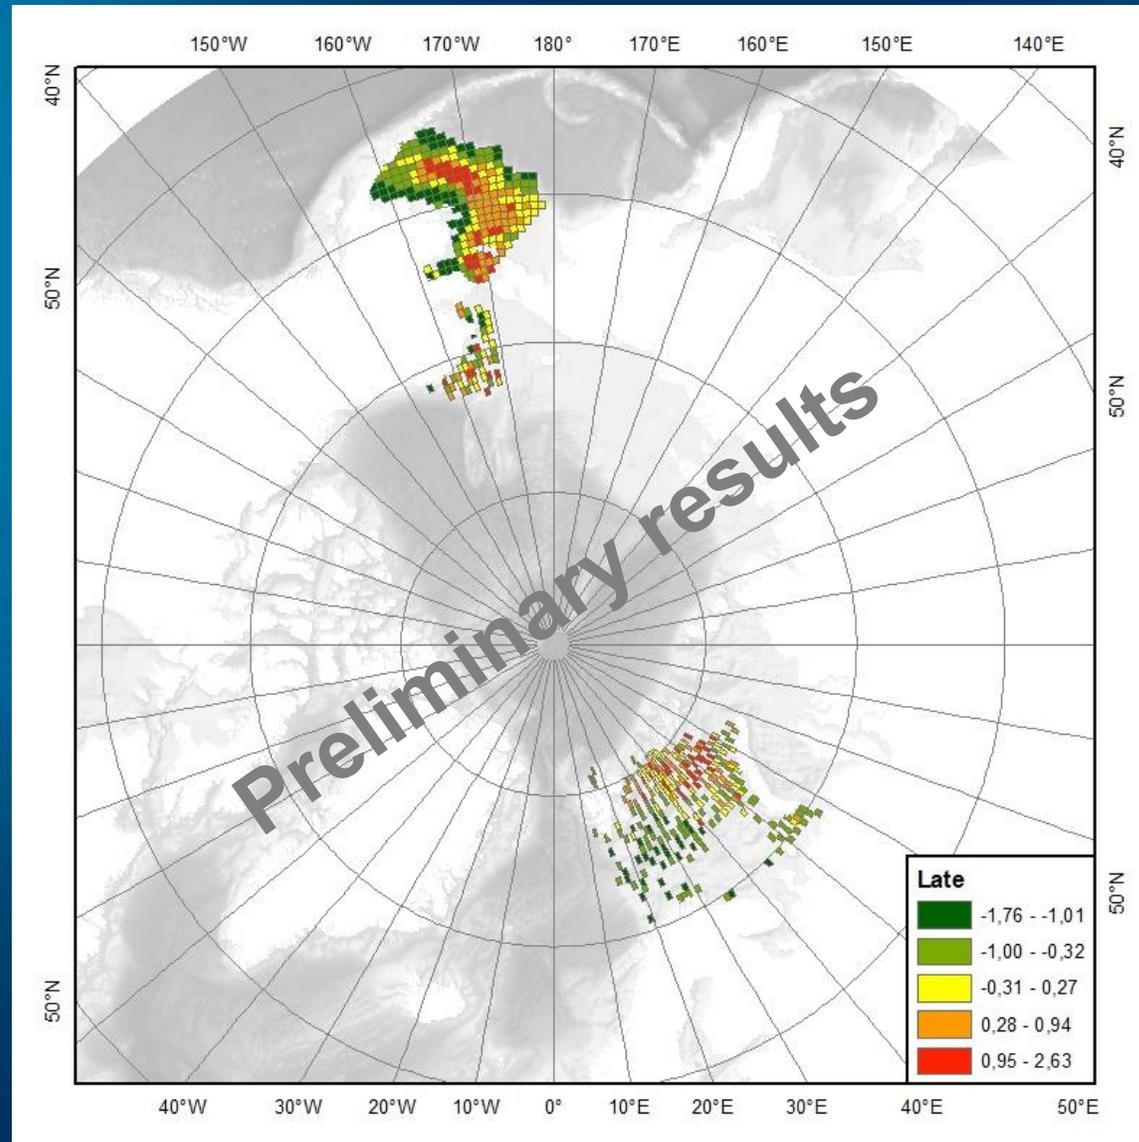

sessile/none	(MV1)	No movement as adult (sponge, coral)
burrower	(MV2)	Movement in the sediment (e.g. annelids, echinoderms, crustacea dwellers).
crawler	(MV3)	An organism that moves along on the substratum via movement of muscles (e.g. crab, snail)
swimmer (facultative)	(MV4)	Movement above the sediment (e.g. Amphipoda)

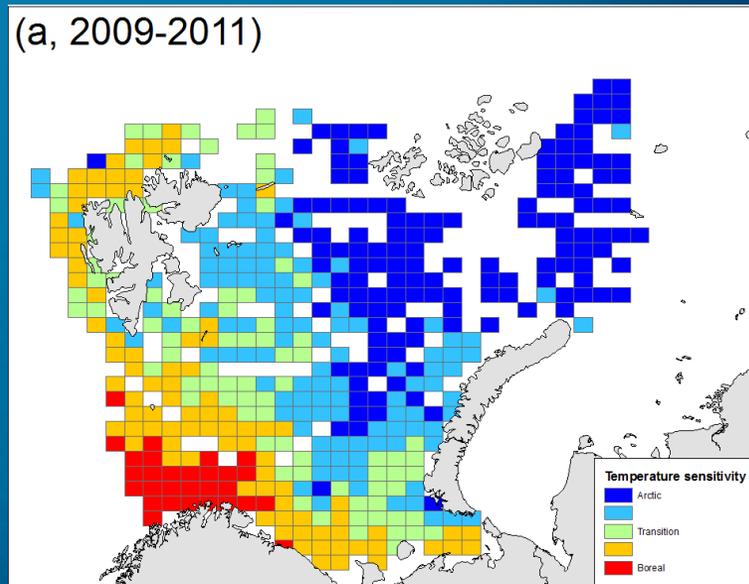

Biomass of trawl vulnerable species

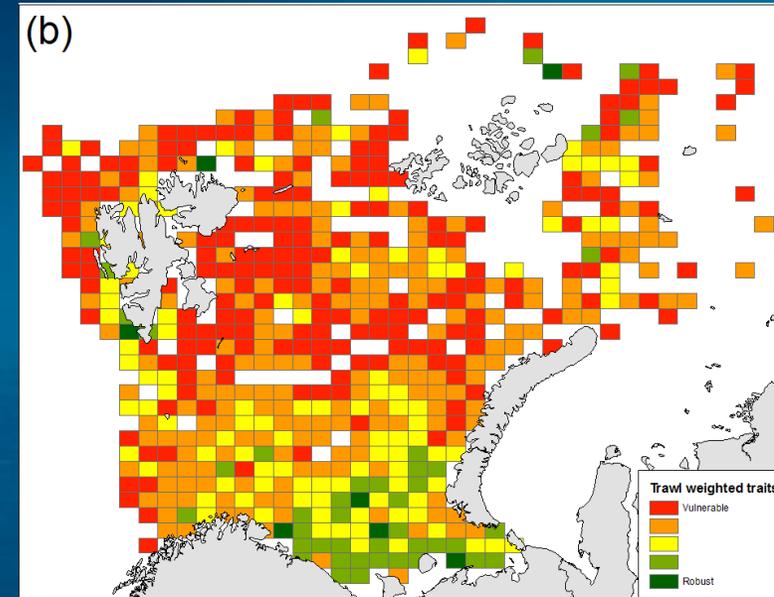

Biomass distribution of coldwater species

Next step: combine temperature and trawl-impact sensitivity to identify vulnerable areas

Mean “species temperature sensitivity”

Mean “species trawl-impact sensitivity”
